There are 7 reasons why the **electric carrier is pivotal** for energy transition

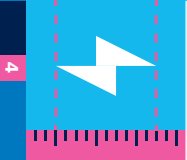

It allows to **reduce CO₂ emissions** when electricity is generated through an energy mix integrating a significant share of renewables and it enables the reduction of pollutant emissions **improving air quality**, in particular in urban areas

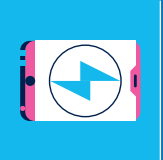

It reduces **noise pollution**, limiting annoyance, stress and sleep disturbance limiting the risks of hypertension and cardiovascular diseases, thus improving the quality of life, in particular in urban areas

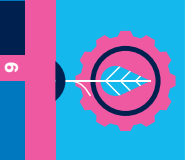

It offers several opportunities to **improve the resilience and the security** of supply of the overall energy system

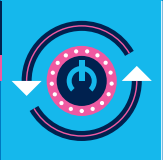

It promotes **higher levels of energy efficiency** reducing the energy demand and the GHG emissions

It can be easily integrated with **digitalization**, enabling more effective energy consumption management and higher energy efficiency

It stimulates **Innovation and sustainability** in lifestyles and industrial processes

It can play an important role in favouring **Circular Economy**, thanks to the innovation brought in renewable energy production, energy storage and structural changes in the system

Policy objectives concerning energy transition are agreed at global, European and national level

■ United Nations Sustainable Development Goals (SDGs) implying a new development paradigm

■ Objectives set by COP21 and Paris agreement, i.e. holding the increase in the global average temperature to well below 2°C above pre-industrial levels, while pursuing efforts to limit it to 1.5°C

■ COP24 Implementation strategy (Katowice rulebook)

Policy targets set at the EU level in the Energy and Climate framework

32%
Share of renewables (RES) on final energy consumption at 2030

At least 40%
GHG emissions cut with respect to 1990s levels

At least 32.5%
Improvement in energy efficiency by 2030

Transposition of the EU policy targets in the **National Energy and Climate Plans**

29.7%
RES share

-40%
GHG emissions vs. 1990

Final energy consumption reduction by **0.8%** per year from 2021 to 2030

42%
RES share

-21%
GHG emissions vs. 1990

39.6%
Improvement in energy efficiency by 2030

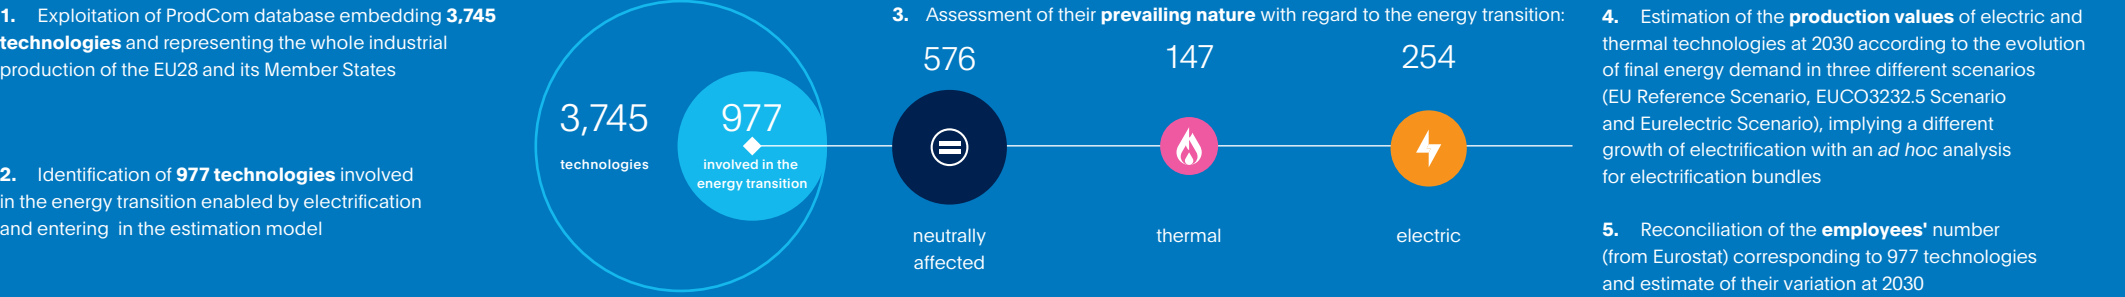

27.9%
RES share

-43.9%
GHG emissions vs. 1990

37.5%
Improvement in energy efficiency by 2030

A brand-new econometric model allows to estimate the **impacts of energy transition in EU28, Italy, Spain and Romania**

| Production Values Results (billion Euros) | | | | | | | | | | | | |
|---|---|--|--|-------|---|--|--|-----|---|--|--|-----|
| | EU28 | | | | Italy | | | | Spain | | | |
| 2017 | <div><div></div><div></div><div></div></div> <div>1,8211,227651</div> | | | 3,699 | <div><div></div><div></div><div></div></div> <div>2678382</div> | | | 432 | <div><div></div><div></div><div></div></div> <div>938927</div> | | | 209 |
| 2030 Reference Scenario | <div><div></div><div></div><div></div></div> <div>2,0281,156769</div> | | | 3,953 | <div><div></div><div></div><div></div></div> <div>2928093</div> | | | 465 | <div><div></div><div></div><div></div></div> <div>1108434</div> | | | 228 |
| 2030 EUCO3232.5 Scenario | <div><div></div><div></div><div></div></div> <div>2,1381,113841</div> | | | 4,092 | <div><div></div><div></div><div></div></div> <div>2977897</div> | | | 472 | <div><div></div><div></div><div></div></div> <div>1198138</div> | | | 238 |

EMPLOYMENT ASSOCIATED WITH ELECTRIC, THERMAL AND NEUTRAL TECHNOLOGIES IN EU28, ITALY, SPAIN AND ROMANIA IN THE REFERENCE, EUCO3232.5 AND EURELECTRIC SCENARIOS (THOUSAND EMPLOYEES), 2017 VS. 2030. SOURCE: THE EUROPEAN HOUSE – AMBROSETTI ELABORATION ON PRODCOM AND EUROSTAT DATA, 2019.

Estimation of the **additional services** than can be activated by electrification and that are not fully grasped by the existing extended value chains

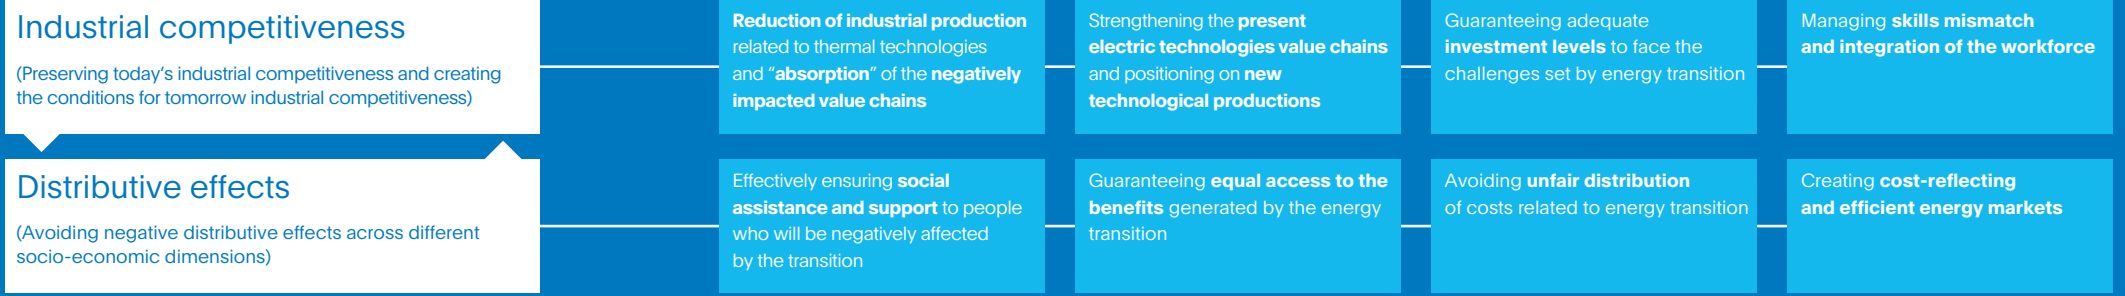

65 billion Euros in the European Union, **6 billion Euros** in Italy, **4 billion Euros** in Spain and **1 billion Euros** in Romania at 2030. The impact of the energy transition on additional services is added to the net differential effect generated by the increase of electric technologies and the decrease of thermal ones between 2017 and 2030. These values might be underestimated. The fact that some digital services are still in a preliminary phase of development and the literature on this topic is limited might lead to an overall underestimation of the value of digital services at 2030

The **impact of energy transition on air quality** has been assessed with regard to transport and residential sectors (accounting for >50% of total emissions in the EU)

The substitution of thermal technologies with electric ones in transport (electric vehicles) and residential sectors (heat pumps) can reduce premature deaths in the EU28, Italy, Spain and Romania, respectively by more than **5,000, 1,000, 500** and **170 units** at 2030. Yet, costs related to air pollution in the EU could be reduced from **1 billion to 2.9 billion Euros at 2030**

Energy transition has to face two key challenges

CHALLENGES ASSOCIATED TO THE ENERGY TRANSITION. SOURCE: THE EUROPEAN HOUSE – AMBROSETTI ELABORATION, 2019.

Four policy matters have been identified in order to tackle the challenges related to energy transition and redistribute its benefits
